Inter-Laboratory Study for the Full Scale Room Fire Test: Results of Tests Conducted at the NFL/IRC

Andrew Kim and Robert Onno

ANALYZED

Internal Report No. 634

Date of issue: November 1992

This is an internal report of the Institute for Research in Construction. Although not intended for general distribution, it may be cited as a reference in other publications

# INTER-LABORATORY STUDY FOR THE FULL SCALE ROOM FIRE TEST: RESULTS OF TESTS CONDUCTED AT THE NFL/IRC 

by

Andrew Kim and Robert Onno

#### Abstract

This report summarizes the National Fire Laboratory's results from Room Burn Tests obtained over three years during which fourteen materials were tested. Most of were wood product lining materials with some insulation materials.

The test method and apparatus description are presented as well as observations and results of the tests. Heat flux values and ceiling temperatures in the room are tabulated as well as flashover time and smoke results. Room temperatures, duct flow rate, duct temperature, as well as $\mathrm{O}_{2}, \mathrm{CO}_{2}, \mathrm{CO}$ concentrations in the duct are also presented. Graphs of heat release rate, heat flux, smoke production and ceiling temperatures are included.

# INTER-LABORATORY STUDY FOR THE FULL SCALE ROOM FIRE TEST: RESULTS OF TESTS CONDUCTED AT THE NFL/IRC 

by<br>Andrew Kim and Robert Onno

## INTRODUCTION

The National Fire Laboratory (NFL) of the Institute for Research in Construction (IRC), National Research Council of Canada (NRCC) has performed full-scale room burn fire tests for a period of three years. This proposed room burn test has generally been accepted as a realistic means of evaluating the fire hazard of room lining materials.

Some of the data has been submitted to an ASTM/ISO Round Robin that studied the repeatability and reproducibility of the test method. All of the room fire test results have been examined for comparison with the NFL's small-scale test results.

This report provides a brief description of the test method, instruments, calibration, as well as the detailed test results.

## DESCRIPTION OF ROOM/CORNER TEST

## Test Method

The objective of the full scale test is to evaluate the flammability of interior lining materials.

The ASTM room/comer test method uses a $2.4 \mathrm{~m} \times 3.7 \mathrm{~m} \times 2.4 \mathrm{~m}$ high room. Test materials cover three of the walls, excluding the wall containing the door. Ignition is carried out by a sand burner in a corner of the room.

The following parameters are obtained from the test: a visual observation of fire development, temperature measurements in the room, heat flux values on the floor, the rate of heat release (RHR), time until flashover and the smoke obscuration in the exhaust duct.

The detailed test method is described in Ref. 1.

## Instruments

A hood system is located above the door and collects the fire gases flowing from the doorway. Measurements of the gas velocity, gas temperature and concentrations of $\mathrm{CO}, \mathrm{CO}_{2}$ and $\mathrm{O}_{2}$ in the exhaust duct provide the means for determining the heat release rate. The heat flux level from the fire is measured by two heat flux radiometers located on the floor. Thermocouples placed on the ceiling measure the temperature rise in the room. Smoke meters are positioned in the duct to measure the smoke obscuration of the fire gases in the duct. A video recorder is positioned outside the room to record the experiment.

## Procedure

The test commences prior to ignition of the sand burner to check and record baseline readings. Following the initial three minutes of non-fire conditions, the sand
burner is ignited. Propane gas flow is adjusted to produce 40 kW in the sand burner for the first five minutes. After five minutes, the propane gas flow to the sand bumer is increased to produce a 160 kW fire. The test is recorded by a video camera and written observations made with corresponding times of important events, such as flashover time. The test is terminated upon flashover or fifteen minutes, whichever event occurs first.

## TEST MATERIALS

Fourteen materials were tested as shown in Table 1. These materials are generic products. Some materials were tested more than once in a given year, and some sample materials were from different batches as denoted by "Sample \#2".

Table 1. Test Materials

| Particle board | 12.3 | 1 | May 13, 1991 |
| Woodpanel | 5 | 1 | May 16, 1991 |

## RESULTS AND DISCUSSION

## Results

The results are presented in separate appendices, each one devoted to a particular experiment.

The first item in each Appendix is a Summary Table, listing some key test results. The time at which the 2 radiometers, located on the floor, reached $20 \mathrm{~kW} / \mathrm{m}^{2}$ is shown. Paper bundles were also placed on the floor in the centre of the room. The time at which these ignited is tabulated, as well as the time that the flame travelled out the doorway. Thermocouples were located in the centre of the room and two inches above the doorway, as well as in other areas. The maximum temperature of these thermocouples as well as the times that they reach $600^{\circ} \mathrm{C}$ are noted. Each of these conditions represents flashover of the room. The maximum rates of smoke and heat production and the times of their peak occurrence are also tabulated.

One part of each Appendix contains information on visual observations of the tests, noting major changes in the fire growth in the room.

Each Appendix also contains a supplementary table which lists a number of other variables changing with time. The data from the thermocouples positioned at the door (DOOR TC) and above the sand burner (CORNER TC) are tabulated here. The duct temperature (DUCT TEMP) and duct flow rate (FLOW RATE) in the exhaust duct are noted. The $\mathrm{CO}, \mathrm{CO}_{2}, \mathrm{O}_{2}$ concentrations in the exhaust duct are also in this table.

In addition, Figures are located at the end of each Appendix presenting graphs of the following variables plotted versus time: rate of heat release, heat flux, smoke production and temperature at the centre of the ceiling.

## Discussion

The data was analyzed as per Ref. 1 and any deviation noted below:
There were some problems encountered with data analysis, primarily as a result of the response and delay time associated with the analyzers. For the $\mathrm{CO}_{2}$ analyzer, a delay time of 5 s and a response time of 1 s was estimated from the calibration tests. For the $\mathrm{O}_{2}$ analyzer, a delay time of 30 s and response time of 5 s was approximated. Since the $\mathrm{O}_{2}$ and $\mathrm{CO}_{2}$ delay times were different, a problem was created when a sudden heat release rate change occurred. To rectify this problem, the $\mathrm{O}_{2}$ readings were adjusted so that the $\mathrm{CO}_{2}$ and $\mathrm{O}_{2}$ delay time would be approximately the same. The $\mathrm{O}_{2}$ value adjustment included moving up the $\mathrm{O}_{2}$ data in the data file so that the changes in $\mathrm{O}_{2}$ readings and the changes in the $\mathrm{CO}_{2}$ readings would correspond to the sand burner ignition. The difference was typically 18 to 24 s .

Another problem encountered was the effect of changing the fan speed near flashover time. The increase in fan speed was necessary during those tests involving a large amount of smoke. This increase in duct flow had a direct influence upon the calculation of the rate of heat release and smoke production values. Since the $\mathrm{O}_{2}$ concentration measured at the time of the fan speed increase does not correspond correctly to the actual value, due to the delay time of the $\mathrm{O}_{2}$ analyzer, an adjustment of 18 s was made by estimating the difference between the time of $\mathrm{O}_{2}$ response and the fan speed change. This means that the first 18 s of increased fan speed values was replaced with the constant fan speed just prior to the increase, for the heat release rate calculation.

Three different smoke meters were used during the testing, a laser, a white light, and an in-house-developed smoke meter. A thorough examination showed that the white light was not providing consistent results, while the in-house-developed smoke meter appeared to be the most representative. The results presented in this report are those results from the in-house-developed smoke meter, unless otherwise specified.

During 1990, tests were terminated instantly upon flashover. Upon analyzing the data, some problems were encountered. The analyzer delay times brought forth the inability of estimating the HRR at the time of flashover, since the $\mathrm{O}_{2}$ concentration levels measured at flashover would be the value 30 s prior. The 1990 results may be missing some of the data at the end of a test due to this delay time. The following modification to the test method was made to remedy this problem: a water spray system was assembled near the end of the exhaust to protect the fan system and the tests were run for a period of time after flashover to accommodate the analyzer delay time.

## SUMMARY

Fourteen materials have been tested in the National Fire Laboratory's full-scale room apparatus. The results of these experiments, as well as observations and test methods, have been presented.

Condition is steady.
Wood panel in the comer on top of the burner is almost burned off revealing gypsum backboard.
Fire exposure in the room decreasing and flashover not likely because woodpanel in the comer is burned off and flame front is progressing weakly in the horizontal direction.
Propane flow increased to $112 \mathrm{~L} / \mathrm{min}(160 \mathrm{~kW})$.
Sandburner flame reaches ceiling.
Woodpanel in the comer is all burned off so nothing is burning in the comer (except the sandburner).
Some flame at the edge between the unburned panel and burned off panel (upper portion approximately 3-4 ft from the corner).
Condition steady.
Sandburner is off.
Some flame at the edge of the unburned panel.
Burned off woodpanel in the comer is a cone shape.
The width of the burned off region is approximately 1 ft in the lower portion (on top of the sand burner), 2 ft in the middle portion and 4 ft in the upper portion.
Flame at the edge of the unburned woodpanel is in the middle portion, with 2-3 in. width and 1-2 ft high.
Very little flame left.
Left side (back wall) flame is self-extinguished.
Right side flame is approximately 2 in . wide and 1 ft high.
Test terminated.

## VISUAL OBSERVATIONS OF THE TEST

Material : $\quad \mathbf{1 2 . 3} \mathbf{m m}$ Fire Retarded Plywood
Date: July 9, 1990
Room Temperature: $\quad 79^{\circ} \mathrm{F}$
Relative Humidity: 54\%
Barometric Pressure: 749.0 mm Hg
Overall description of test and test material: Followed ASTM test procedures
Observations of the test:
Time (min:sec) Observations
$0: 00 \quad$ Ignition of the sand burner ( 40 kW ).
$0: 15 \quad$ Flame tip reaches 3 ft above the burner.
$0: 30 \quad$ Flame tip reaches 4 ft above the burner.
Plywood on both sides starts to char.
1:00 Flame tip reaches 5 ft above the burner.
$1: 45 \quad$ Plywood on both sides of the corner heavily charred.
Plywood ignition difficult to determine (no ignition, i.e., no flame from the plywood).
4:00 Condition steady.
No ignition of plywood.
5:00 Propane flow increased to 160 kW .
$5: 15 \quad$ Flame tip reaches ceiling.
Light smoke layer in the room (approximately 3 ft deep)
5:30 Plywood on both sides of the corner heavily charred, but still no ignition.
Flame tip reaches ceiling and deflected at the ceiling and runs along the ceiling/wall joint, flame tip flickers along the ceiling as far as $3-4 \mathrm{ft}$ from the comer.
6:30
7:00
Light smoke coming out through the doorway.
Plywood at the top corner ignites.
Condition steady.
Flame tip reaches ceiling and runs along the ceiling/wall joint reaching 3-4 ft from the corner.
$11: 00$

11:30
Plywood at the comer is heavily charred. Char pattern is an inverted cone shape 1 ft wide at the bottom and 2 ft wide near the ceiling, also char patterns run along the ceiling/wall joint, 3-4 ft from the comer 1 ft wide.

12:00
Steady light smoke coming out through the top of the doorway.
Plywood burning near the comer at the top and just above the sand burner.
Flame pattern is steady.
13:45
14 : 30
Pieces of charred plywood are falling off from the top corner.

15:00
Plywood at the corner is all burned off from above the sand burner to the ceiling, exposing gypsum backboard.

15:05
Propane flow to the sand burner is shut off.
Some flickering flame on the charred plywood above the burner and at the ceiling/wall joint near the corner.
15:30 Pieces of charred plywood are falling off from the top comer.
16:30
19:00
Very little flame remaining on the charred plywood.
Test terminated, no flame visible.

## SUMMARY TABLE OF RESULTS

| Item | Results |
| :--- | :---: |
| Test material | 25.1 mm polyurethane |
| Test number | 1 |
| Date of test | July 17,1990 |
| Time to ignition of walls (left / right) | $15 \mathrm{~s} / 15 \mathrm{~s}$ |
| Time at which $20 \mathrm{~kW} / \mathrm{m}^{2}$ reach at each radiometer | DNO |
| Time at which paper targets ignite | 6 min 25 s |
| Time of flame out of doorway | 6 min 20 s |
| Maximum temperature at centre of room / time occurred | $519^{\circ} \mathrm{C} / 6 \mathrm{~min} 20 \mathrm{~s}$ |
| Maximum temperature at the doorway $/$ time occurred | $446^{\circ} \mathrm{C} / 6 \mathrm{~min} 20 \mathrm{~s}$ |
| Time $600^{\circ} \mathrm{C}$ was obtained by TC at the centre of the room | DNO |
| Time $600^{\circ} \mathrm{C}$ was obtained by the TC at the doorway | DNO |
| Maximum instantaneous smoke produced $/$ time occurred | $0.52 \mathrm{OD} / 5 \mathrm{~min} 35 \mathrm{~s}$ |
| Maximum instantaneous heat release / time occurred | $721 \mathrm{~kW} / 6 \mathrm{~min} 10 \mathrm{~s}$ |

DNO - Did not occur

## VISUAL OBSERVATIONS OF THE TEST

Material: $\quad 25.1 \mathrm{~mm}$ Polyurethane
Date: $\quad$ July 17, 1990
Room Temperature: $\quad 81^{\circ} \mathrm{F}$
Relative Humidity: $62 \%$
Barometric Pressure: 754.8 mm Hg
Overall description of test and test material: Followed ASTM test procedures Exhaust fan switched to high during the test

Observations of the test:
Time (minisec) Observations
$0: 00 \quad$ Ignition of the sand burner ( 40 kW ).
$0: 10 \quad$ Flame reaches the ceiling producing heavy dark smoke.
$0: 15 \quad$ Samples on both sides of the comer ignite.
$0: 20 \quad$ Smoke layer in the room 4 ft deep.
Dark smoke coming out through the doorway.
$0: 40 \quad$ Flame has receded a little.
Flame tip reaches 5 ft above the burner.
Samples near the corner burning but not as strong as before.
Steady smoke coming out through the doorway.
1:15
Flame height (tip) is 4 ft .
$1: 30 \quad$ Sample is charred and not burning.
Flame height is 3 ft (sandburner flame only).
2:00 Char on the sample is cone shaped and 1 ft wide near the burner and
5 ft high above the burner.
Flame is ignition (sandburner) flame only.
Smoke layer in the room is lighter and little smoke coming out through the doorway.
4:00
Condition steady.
$5: 00 \quad$ Propane flow increased to 160 kW .
Flame reaches ceiling and deflected and progressing along the ceiling/wall joint reaching approximately 5 ft from the corner. Both walls (samples) at the corner ignite again and bum (steadily).
Black smoke layer in the room is 4 ft deep.
Black smoke coming out through the doorway.
5:35
Samples are burning very well.
Black smoke layer in the room and flame is present in the ceiling among the smoke layer.
Smoke coming out through the doorway is heavy.
5:45 Exhaust fan speed changed to high.
6:00
Both walls burn fiercely.
Black smoke coming out of the room.
Flame can be seen in the ceiling among the smoke layer.
6:20 Flame starts to come out of the room through the doorway.
6:25
Steady flame comes out of the room.
Both paper bundles ignite.
Test terminated.

Ignition of the sand burner ( 40 kW ).
Flame tip reaches 3 ft above the burner (i.e., flame height is 3 ft )
Samples on both sides of the corner start to char (or become black).
Flame height is still 3 ft .
Flame height is still 3 ft .
Light smoke layer at the ceiling.
Samples on both sides of the corner ignite.
Flame height is 4 ft .
Both walls are burning at the corner.
Flame height is 5 ft .
Flame height is 6 ft .
Flame tip reaches ceiling.
Both walls are burning well.
Flame tip reaches ceiling.
Flame reaches ceiling and reflected at the ceiling, however, does not progress along the ceiling/wall joint.
Condition is steady.
Flame is receding.
Samples are heavily charred near the corner but have little flaming.
No flaming fire on the sample.
Flame height is 5 ft .
Flame height is 4 ft .
Flame height is 3 ft (sandburner ignition flame only).
Propane flow increased to 160 kW .
Flame reaches ceiling.
Samples are burning again.
Flame is reflected at the ceiling and is progressing along the ceiling/wall joint to a distance of 4 ft from the corner.
Samples are burning well.
Light smoke is produced.
Light smoke is coming through the doorway.
Flame runs along the ceiling/wall joint to the other corner.
Smoke layer at the ceiling. Flame is also progressing along the ceiling near the corner.
Samples are burning 2 ft wide at the corner and 1 ft down from the ceiling on the back wall and the side wall.
Samples are burning 3 ft wide at the corner.

Smoke coming out through the doorway.

7:07
7:08

Flame starts to come out through the doorway.
Exhaust fan speed changed to high.
Both paper bundles ignite.
Fire extinguished.
Test terminated.

Ignition of the sand burner ( 40 kW ).
Flame height is 3 ft (flame tip reaches 3 ft above the burner).
Flame height is 4 ft .
Samples on both side of the corner starts to char.
Flame height is 5 ft .
Light smoke layer in the room is 2 ft deep.
Flame height is 4 ft .
Flame height is 4 ft .
Samples near the corner are charred, but there is no flame on the sample.
Flame height is 5 ft .
Light smoke layer in the room 2 ft deep.
Propane flow increased to 160 kW .
Flame reaches the ceiling and deflected along the ceiling/wall joint (flame tip extends 4 ft from the comer along the ceiling/wall joint).
Sample is charred near the corner all the way to the ceiling.
Some flames visible on the charred surface of the sample at the top near the corner.
Condition is steady.
Light smoke layer in the room, but no visible smoke coming out through the doorway.
Burning of the charred surface of the sample at the top near the comer is increased. burning and the flame front extends all the way to the other corners along the ceiling/wall joint.
Papers on the gypsumboard at the ceiling are burning.
Flames visible on the ceiling.
Smoke is coming out through the doorway.
Exhaust fan speed changed to high.
No visible flame on the ceiling.
Flame is receding a little.
Flame reaches ceiling, but does not extend along the ceiling/wall joint.
Top portion of the samples on both walls heavily charred and some flames are visible on the charred surface.

Room is filled with light grey smoke.
Steady light smoke coming out through the doorway.

15:00
$15: 10$
$16: 00$

Propane flow shut off.
Some flames on the charred surface of the sample.
Some portion of the sample near the comer is burned off.
Sample is charred at the top about 2 ft deep all the way around the room.
Sample heavily charred near the comer and some portion of the sample is completely burned and charred pieces fall off exposing backing board (gypsumboard).
Some flames at the top charred surface are visible.
No flame is visible.
Test terminated.

DNO - Did not occur

# VISUAL OBSERVATIONS OF THE TEST 

Material: $\quad 26.1 \mathrm{~mm}$ Polystyrene
Date: $\quad$ July 31, 1990
Room Temperature: $70^{\circ} \mathrm{F}$
Relative Humidity: 60\% Barometric Pressure: 751.0 mm Hg

Overall description of test and test material: Followed ASTM test procedures Ignition 5 s too early

Observations of the test:

| Time (min:sec) | Observations |
| :---: | :---: |
| 0:00 | Ignition of the sand burner ( 40 kW ). |
| 0:05 | Flame height is 3 ft (flame tip reaches 3 ft above the burner). |
| 0:10 | Sample starts to melt at the corner. |
| 0:30 | Samples at the comer melted away exposing the backboard (melted area is cone-shaped with a 1 ft base and reaching 3 ft above the burner). |
| 0:40 | Flame height is 4 ft . |
|  | Black smoke is produced at the comer. |
| 0:50 | Black smoke layer in the room is 3 ft deep. |
|  | Black smoke starts to exit through the doorway. |
| 1:10 | Samples near the burner start to burn as it melts. |
|  | Flame height reaches ceiling through the black smoke layer. |
| 2:00 | Flame at the corner is big, approximately 1 ft diameter column of flame reaching the ceiling through the black smoke layer. |
|  | Black smoke layer on the ceiling is 4 ft deep. |
| 2:30 | Flame is receding. |
|  | Some portion of sample near the burner is burning as it melts. Smoke production in the comer is reduced. |
|  | Room is still filled with dark smoke, but the amount of smoke coming out through the doorway is reduced. |
| $3: 30$ | Flame at the comer is ignition flame only. |
|  | No sample remaining near the ignition flame to burn. |
|  | Room has light smoke layer in the ceiling, but no visible smoke coming out through the doorway. |
| 5:00 | Propane flow increased to 160 kW . |
|  | Flame tip reaches the ceiling. |
| 5:30 | Samples are melting again near the flame and start to burn as they melt. |
| $5: 50$ | Black smoke layer in the room is 4 ft deep. |
|  | Black smoke again comes out through the doorway. |
| 6:00 | Samples are melting down and buming. |
| 6:50 | Top portion of the samples on both walls of the corner are melting down. |
| 7:00 | Black smoke coming out of doorway is reduced. |
| 7:30 | Small portion of the sample is still burning as it is melting down, but the amount that is burning is very small. |
| 10:00 | Ignition flame is the only flame in the room. |

No sample remaining near the ignition flame to burn.

15:00
15:05
16:00
Light grey smoke layer in the room 3 ft deep.
No visible smoke coming out through the doorway.
Propane flow to the sand burner shut off.
No flame in the room.
Test terminated.
Damage to the room is that samples near the corner, approximately 3 ft wide on each wall are all melted away exposing the backboard. This extends to the ceiling. Also, top portion of each wall (joining the sandburner comer) is melted away, approximately 3 ft from the ceiling and all the way around.

## APPENDIX K: 6 mm WOODPANEL

## SUMMARY TABLE OF RESULTS

|  | Results |
| :--- | :---: |
| Item |  |
| Test material | 6 mm woodpanel |
| Test number |  |
| Date of test |  |
| Time to ignition of walls (left / right) | November 1,1990 |
| Time at which 20 kW/m reach at each radiometer | $40 \mathrm{~s} / 40 \mathrm{~s}$ |
| Time at which paper targets ignite | $6 \mathrm{~min} 10 \mathrm{~s} / 6 \mathrm{~min} 10 \mathrm{~s}$ |
| Time of flame out of doorway | 6 min 10 s |
| Maximum temperature at centre of room / time occurred | 6 min 35 s |
| Maximum temperature at the doorway / time occurred | $839^{\circ} \mathrm{C} / 6 \mathrm{~min} 30 \mathrm{~s}$ |
| Time $600^{\circ} \mathrm{C}$ was obtained by TC at the centre of the room | $607^{\circ} \mathrm{C} / 6 \mathrm{~min} 30 \mathrm{~s}$ |
| Time $600^{\circ} \mathrm{C}$ was obtained by the TC at the doorway | 5 min 35 s |
| Maximum instantaneous smoke produced /time occurred | 0.36 min 30 s |
| Maximum instantaneous heat release / time occurred | $966 \mathrm{~kW} / 6 \mathrm{~min} 30 \mathrm{~s}$ |
|  |  |

## VISUAL OBSERVATIONS OF THE TEST

Material: $\quad 6 \mathrm{~mm}$ Woodpanel
Date: $\quad$ November 1, 1990
Overall description of test and test material: Followed ASTM test procedures Fan speed switched to high during the test

Observations of the test:

## Time (min:sec) Observations

$0: 00 \quad$ Ignition of the sand burner ( 40 kW )
$0: 30 \quad$ Flame height is 3 ft .
$0: 40 \quad$ Both walls at the corner ignite.
Flame height is 4 ft .
1:05
Flame height is 5 ft .
$1: 30$
Flame height is 6 ft .
$2: 30 \quad$ Flame reaches ceiling.
Light smoke layer in the room.
$3: 30 \quad$ Flame is reflected at the ceiling and flame tip runs along the ceiling/wall joint reaching 4 ft from the corner.
Light smoke layer in the room approximately 4 ft deep.
4:00
5:00

5:10
5:20
Light smoke starting to come out through the doorway.
Propane flow increased to 160 kW .
Flame is running along the ceiling/wall joint steadily.
Dark smoke is coming out through the doorway.

Upper portion at the room (near ceiling) is filled with dark smoke and flames.
Steady dark smoke coming out.
6:05
Fan speed changed to high.
6:10 Flame starts to come out through the doorway.
6:25
Both paper bundles ignite.
6:30 Test terminated.
Steady flames coming out.

## APPENDIX L: $\mathbf{1 2 . 3} \mathbf{~ m m}$ PARTICLEBOARD

| Item | Results |
| :--- | :---: |
| Test material | 12.3 mm particleboard |
| Test number | 1 |
| Date of test | February 22,1991 |
| Time to ignition of walls (left / right) | $20 \mathrm{~s} / 20 \mathrm{~s}$ |
| Time at which 20 kW/m |  |
| Time at which paper targets ignite | $5 \mathrm{~min} 40 \mathrm{~s} / 5 \mathrm{~min} 40 \mathrm{~s}$ |
| Time of flame out of doorway | 6 min |
| Maximum temperature at centre of room / time occurred | $865^{\circ} \mathrm{Cin} 45 \mathrm{~m}$ |
| Maximum temperature at the doorway $/$ time occurred | $699^{\circ} \mathrm{C} / 6 \mathrm{~min} 30 \mathrm{~s}$ |
| Time $600^{\circ} \mathrm{C}$ was obtained by TC at the centre of the room | 5 min 20 s |
| Time $600^{\circ} \mathrm{C}$ was obtained by the TC at the doorway | 5 min 30 s |
| Maximum instantaneous smoke produced / time occurred | $0.25 \mathrm{OD} / 6 \mathrm{~min}$ |
| Maximum instantaneous heat release / time occurred | $924 \mathrm{~kW} / 6 \mathrm{~min} 40 \mathrm{~s}$ |

## VISUAL OBSERVATIONS OF THE TEST

Material: $\quad 12.3 \mathrm{~mm}$ Particleboard
Date: $\quad$ February 22, 1991
Overall description of test and test material: Followed ASTM test procedures
Water spray applied at flashover time
Observations of the test:
Time (min;sec) Observations
$0: 00 \quad$ Ignition of the sand burner ( 40 kW )
$0: 05 \quad$ Flame height is 3 ft above the burner.
0:20
Both walls at the comer ignite.
Flame height is 4 ft above the burner.
Flame front is 2 ft above the burner.
$1: 30 \quad$ Flame tip is intermittently reaching the ceiling.
Flame front is 4 ft above the burner.
2:00
2:30
Flame steadily reaches ceiling.
Flame front is 6 ft above the burner.
Flame front reaches ceiling.
Flame is reflected at the ceiling and flame tip runs along the ceiling/wall joint.
3:00 Flame is steadily running along the ceiling/wall joint reaching 4 ft from the comer.
No smoke visible in the room.
4:00
Flame is steady.
Flame tip reaches 5 ft from the corner along the ceiling/wall joint.
Light smoke is produced and some light smoke is coming out through the doorway.
4:30 Flame seems to be a little receded.
Steady flame, but not as intense as before.
Room is filled with light grey smoke in the upper area.
5:00
Propane flow increased to 160 kW .
5:10
Ceiling is covered with flame.
Dark smoke is produced and some is coming out through the doorway.
$5: 15 \quad$ Upper portion of the room is filled with flame and dark smoke.
$5: 20 \quad$ A large amount of dark smoke is coming out through the doorway and smoke is spilling over the canopy area.
5:45 Flickering flames start to come out through the doorway.
Water spray in the exhaust duct to protect the fan system from the flames has been turned on.
6:00 Steady flame is coming out of the room through the doorway.
Dark smoke is also coming out through the doorway.
Top half of the room is filled with flame and some dark smoke.
Dark smoke spills over the canopy.
6:15 Steady flame comes out the doorway and goes into the canopy system.
6:20 Canopy is almost full of flame underneath.
$6: 30 \quad$ Steady flame is going into the canopy in full strength.
6:40
Water sprayed into the room.
Fire extinguished.
Test terminated.

| Maximum instantaneous smoke produced $/$ time occurred | $0.13 \mathrm{OD} / 9 \mathrm{~min} 30 \mathrm{~s}$ |
| Maximum instantaneous heat release / time occurred | $941 \mathrm{~kW} / 9 \mathrm{~min} 20 \mathrm{~s}$ |

# VISUAL OBSERVATIONS OF THE TEST 

Material: $\quad 12.3 \mathrm{~mm}$ Plywood
Date: April 8, 1991
Overall description of test and test material:
Followed ASTM test procedures Fan speed started in high position Water spray applied at flashover time

Observations of the test:

## Time (minisec) Observations

$0: 00 \quad$ Ignition of the sand burner ( 40 kW ).
0:25
Both walls at the corner ignite.
$1: 00 \quad$ Flame height is 6 ft above the burner.
Flame front reaches 2 ft above the burner.
1:30 Flame tip reaches ceiling intermittently.
Flame front is 4 ft above the burner.
$2: 10 \quad$ Flame tip reaches ceiling steadily.
Flame front is 6 ft above the burner.
$2: 30 \quad$ Flame tip is reflected at the ceiling and runs along the ceiling/wall joint approximately 2 ft from the corner.
3:00 Flame tip runs along the ceiling/wall joint approximately 3 ft from the corner.
3:30 Flame front (charred surface) runs along the corner to the ceiling and runs along the ceiling/wall joint approximately 3 ft from the corner.
4:00 Flame is receding.
Flame mostly along the corner and some flame present on the charred surface at the ceiling/wall joint.
$4: 30$
5:00
$5: 20$

5:30
Flame is further receding.
Flame is confined to the comer barely reaching the ceiling.
Propane flow increased to $0.112 \mathrm{~m}^{2} / \mathrm{min}(160 \mathrm{~kW})$.
Flame is very strong and runs along the comer and reflected and runs along the ceiling/wall joint approximately 6 ft from the corner.
Flame runs along the ceiling/wall joint all the way to the other side ( 8 ft from the corner).
Smoke is starting to come out through the doorway.
7:30
Smoke layer is 3 ft in the room.
Flame is progressing downward on the sidewall from the top approximately 2 ft down from the top.
$8: 50 \quad$ Water spray in the exhaust duct was turned on.
Flame is progressing along the ceiling.

$$
8: 55
$$

9:10
$9: 30 \quad$ Some smoke is spilling over the canopy.
Flame starts to come out through the doorway.
Ceiling is filled with dark smoke and flame ( 4 ft deep)
Both paper bundles ignited.
Steady flame is coming out through the doorway.
Upper half of the room is filled with dark smoke and flame.
Steady flame is going into the canopy.
Test terminated.

APPENDIX O: 40 mm POLYURETHANE WITH FOIL

## SUMMARY TABLE OF RESULTS

| Item | Results |
| :--- | :---: |
| Test material | 40 mm polyurethane with foil |
| Test number | 1 |
| Date of test | April 30,1991 |
| Time to ignition of walls (left / right) | $15 \mathrm{~s} / 15 \mathrm{~s}$ |
| Time at which $20 \mathrm{~kW} / \mathrm{m}^{2}$ reach at each radiometer | DNO |
| Time at which paper targets ignite | DNO |
| Time of flame out of doorway | DNO |
| Maximum temperature at centre of room / time occurred | $366^{\circ} \mathrm{C} / 12 \mathrm{~min} 5 \mathrm{~s}$ |
| Maximum temperature at the doorway $/$ time occurred | $310^{\circ} \mathrm{C} / 12 \mathrm{~min} 10 \mathrm{~s}$ |
| Time $600^{\circ} \mathrm{C}$ was obtained by TC at the centre of the room | DNO |
| Time $600^{\circ} \mathrm{C}$ was obtained by the TC at the doorway | DNO |
| Maximum instantaneous smoke produced $/$ time occurred | $0.11 \mathrm{OD} / 5 \mathrm{~min} 25 \mathrm{~s}$ |
| Maximum instantaneous heat release $/$ time occurred | $219 \mathrm{~kW} / 5 \mathrm{~min} 35 \mathrm{~s}$ |

DNO - Did not occur

## VISUAL OBSERVATIONS OF THE TEST

Material: $\quad 40 \mathrm{~mm}$ Polyurethane with foil covering

| Date: | April 30, 1991 |  |
| :--- | :--- | :--- |
|  | Temperature: | $59{ }^{\circ} \mathrm{F}$ |
|  | Relative Humidity: | $82 \%$ |

Overall description of test and test material: Followed ASTM test procedures Fan speed started in high position

Observations of the test:
Time (min;sec) Observations
$0: 00 \quad$ Ignition of the sand burner ( 40 kW ).
$0: 15 \quad$ Test sample ignited on both sides of the corner.
$0: 40 \quad$ Ceiling is filled with grey smoke.
Smoke layer is approximately 2 ft deep.
$1: 15 \quad$ Flame height is 4 ft above the burner.
Smoke layer is approximately 3 ft deep.
Flame front is approximately 3 ft above the bumer.
$1: 30 \quad$ Light smoke is coming out through the doorway in small quantities.
3:00 Condition steady.
3:30 Flame front is approximately 4 ft above the burner.
Flame height is approximately 5 ft above the burner.
$5: 00 \quad$ Propane flow increased to 160 kW .
Flame reaches ceiling and reflected at the ceiling and runs 2-3 ft
along the ceiling/wall joint.
Black smoke is produced.
Ceiling filled with black smoke.
Black smoke is coming out through the doorway.
Smoke layer in the ceiling is 4 ft deep.
5:30 Flame reaches ceiling.
Samples at the corner buming well.
6:00 Flame condition steady.
Smoke layer changed from black smoke to dark grey smoke.
6:30 Flame condition steady.
Room is filled with light smoke and no clear smoke layer exists.
8:00
10:00
Condition steady.
Flame condition steady.
Room is clear of smoke.
No smoke layer in the ceiling.
12:00 Condition steady.
Sample is burning at the corner but not feeding the flame to spread.
15:00
Ignition is shut off.
No flame visible in the room.
Flashover not reached during the test period.
Aluminum foil burned off at the corner approximately 1 ft wide all the way to the ceiling and polyurethane underneath is burned and charred. Other area (except in the corner) has aluminum foil in place and not damaged.
Test terminated.

## APPENDIX P: 6 mm CHIPBOARD

| Item | Results |
| :--- | :---: |
| Test material | 6 mm chipboard |
| Test number | 1 |
| Date of test | May 7,1991 |
| Time to ignition of walls (left / right) | $20 \mathrm{~s} / 40 \mathrm{~s}$ |
| Time at which $20 \mathrm{~kW} / \mathrm{m}^{2}$ reach at each radiometer | $4 \mathrm{~min} 25 \mathrm{~s} / 4 \mathrm{~min} 25 \mathrm{~s}$ |
| Time at which paper targets ignite | 4 min 35 s |
| Time of flame out of doorway | 4 min 15 s |
| Maximum temperature at centre of room / time occurred | $85^{\circ} \mathrm{C} / 5 \mathrm{~min}$ |
| Maximum temperature at the doorway / time occurred | $686^{\circ} \mathrm{C} / 5 \mathrm{~min} 10 \mathrm{~s}$ |
| Time $600^{\circ} \mathrm{C}$ was obtained by TC at the centre of the room | 4 min 10 s |
| Time $600^{\circ} \mathrm{C}$ was obtained by the TC at the doorway | 4 min 10 s |
| Maximum instantaneous smoke produced $/$ time occurred | $0.26 \mathrm{OD} / 4 \mathrm{~min} 40 \mathrm{~s}$ |
| Maximum instantaneous heat release / time occurred | $1908 \mathrm{~kW} / 4 \mathrm{~min} 55 \mathrm{~s}$ |

## VISUAL OBSERVATIONS OF THE TEST

| Material: | 6 mm Chipboard |  |
| :--- | :--- | :--- |
| Date: | May 7, 1991 |  |
|  | Temperature: | $60^{\circ} \mathrm{F}$ |
|  | Relative Humidity: | $49 \%$ |

Overall description of test and test material: Followed ASTM test procedures
Observations of the test:

## Time (min;sec) Observations

$0: 00 \quad$ Ignition of the sand burner ( 40 kW )
$0: 20 \quad$ One side of the corner wall ignites.
$0: 40 \quad$ Other side of the corner wall ignites.
0:45 Flame front reaches 2 ft above the burner.
Flame tip reaches 5 ft above the burner.
$\begin{array}{ll}1: 15 & \text { Flame tip reaches ceiling. } \\ 2: 00 & \text { Flame front reaches ceiling }\end{array}$
Flame tip is reflected at the ceiling and runs along the ceiling/wall joint 4 ft from the comer.
2:45 Flame tip reaches other side of the wall running along the ceiling/wall joint ( 8 ft from the corner).
$3: 15 \quad$ Flame front (charred portion) is 1.5 ft wide along the corner all the way to the ceiling and runs along the ceiling/wall joint approximately 1 ft down from the ceiling all the way to the other side.
3:45 Light smoke coming out through the doorway.
4:10 Flame starts to run along the ceiling.
Dark smoke layer in the ceiling 3 ft deep.
4:20
Ceiling is filled with dark smoke and flame.
4:25 Flame starts to come out through the doorway.
Dark smoke and flame mixture layer in the ceiling is 3 ft deep.
4:35
First paper bundle ignites.
4:45 Steady flame is coming out through the doorway.
Dark smoke coming out the doorway.
Upper half of the room ( 4 ft deep) is filled with black smoke and flames.
5:00 Second paper bundle ignites.
Steady flames and black smoke coming out.
$5: 10 \quad$ Steady flames coming out the doorway.
Black smoke coming out the doorway and spills over the canopy hood.
$5: 15 \quad$ Test terminated.

Observations of the test:

## Time (minisec) Observations

$0: 00 \quad$ Ignition of the sand burner ( 40 kW ).
$0: 20 \quad$ Both sides of the corner wall ignite.
$0: 45 \quad$ Flame front is 2 ft above the sand burner.
Flame tip is 4 ft above the sand burner.
1:20
2:00

2:20
3:00 Flame tip reaches 8 ft (other end) from the comer along the
3:10
3:45
4:15
lame tip reaches ceiling.
Flame front is 6 ft above the burner.
Flame tip is deflected at the ceiling and runs along the ceiling/wall joint to approximately 2 ft from the corner.
Flame front reaches ceiling.
Flame tip reaches 4 ft from the corner along the ceiling/wall joint. ceiling/wall joint.

都 smoke is coming out through the doorway.

5:00
5:05
Flame is growing steadily.
$5: 15 \quad$ Dark smoke is coming out through the doorway.
Ceiling is filled with dark smoke and flames.
$5: 20 \quad$ Upper half of the room ( 4 ft deep) is full of black smoke and flames.
5:40 Flame starts to come out of the doorway.
$5: 50 \quad$ Flames come out the doorway intermittently.
5:55
Both paper bundles ignite.
6:00 Steady flames are coming out through the doorway.
A lot of black smoke coming out through the doorway and spills over the canopy.
6:25 Test terminated.
