ANALYZED

Technical Paper No. 250
of the
Division of Building Research

OTTAWA

September 1967

FOREWORD

The sources of the information contained herein are the published reports of firetests conducted in accordance with the Standard Methods of Test adopted by decree of the French Government.

Tests of assemblies that contain materials identified by trade name only have been excluded from this paper because these assemblies are not adequately identified by description and it would be difficult to apply the information to Canadian practice.

SPECIAL INTRODUCTION

THIS PUBLICATION HAS BEEN PREPARED TO MAKE AVAILABLE TO CANADIAN READERS PUBLISHED INFORMATION ON FIRE ENDURANCE OF BUILDING ASSEMBLIES OF THE FIRE RESEARCH ORGANIZATION IN FRANCE. IT IS INTENDED FOR INFORMATION PURPOSES ONLY AND IS NOT TO BE REGARDED AS AN OFFICIAL LISTING OR RATING. SUPPLEMENT NO. 2 TO THE NATIONAL BUILDING CODE PROVIDES SUCH RATINGS FOR COMMON MATERIALS AND SYSTEMS CAPABLE OF BEING IDENTIFIED ADEQUATELY BY DESCRIPTION, WHICH MAY BE USED IN THE ABSENCE OF SPECIFIC TEST INFORMATION OR OTHER CERTIFICATION. BUT THE DESIGNER, MANUFACTURER, OR BUILDING OFFICIAL MAY FIND IT NECESSARY TO EXERCISE JUDGEMENT ON MATERIALS OR SYSTEMS DIFFERING FROM THOSE FOR WHICH TEST OR RATING INFORMATION IS AVAILABLE, AND IN SUCH CASES THE INFORMATION NOW ASSEMBLED MAY BE USEFUL.

ALL THE TEST INFORMATION IN THIS PUBLICATION IS INCLUDED WITH THE PERMISSION OF THE ORIGINAL AUTHORS. IN MANY CASES THE DETAILED DESCRIPTIONS PROVIDED IN THE ORIGINAL PUBLICATIONS HAVE HAD TO BE ABBREVIATED OR OMITTED. REFERENCE SHOULD ALWAYS BE MADE TO THE ORIGINAL PUBLICATIONS FOR VERIFICATION OF THE DESCRIPTION AND METHOD OF TEST BEFORE PLACING GREAT WEIGHT ON INDIVIDUAL VALUES. THE VARIOUS ITEMS ARE CROSS-REFERENCED TO THE BIBLIOGRAPHY WHICH LISTS THE SOURCE PUBLICATIONS. NO REPRODUCTION SHOULD BE MADE OF ANY OF THIS MATERIAL WITHOUT THE PERMISSION OF THE ORIGINAL PUBLISHERS.

ACKNOWLEDGEMENT

THE PERMISSION GIVEN BY AUTHORS
TO REPRODUCE THE MATERIAL ON WHICH THIS
PUBLICATION IS BASED IS GREATLY APPRECIATED.

A SELECTION OF STANDARD FIRE ENDURANCE TESTS
BY THE FIRE RESEARCH STATION IN FRANCE

by

Murdoch Galbreath

The National Building Code of Canada recognizes several standard methods of test for fire endurance of building components. These are:

1. CSA B54.3 and 5 of the Canadian Standards Association;
2. ASTM E119 and E152 of the American Society for Testing and Materials;
3. BS 476 of the British Standards Institution.

These tests all follow the same general lines but differ in details. There is much test information available that is based on the French fire test, and though it may not be considered to meet the provisions of the National Building Code, it can provide useful information relating to the fire performance of building assemblies.

The Standard Fire Test used in France is the result of an order concerning fire resistance of building components issued by the Ministry of the Interior in January 1959. An examination of the conditions of test shows a broad similarity between the French test and those noted above, except in the size of the test specimens.

FURNACE TEMPERATURES

In the French test, furnace temperatures follow a time-temperature curve based on the expression

$$T - T_0 = 345 \log_{10} (8t + 1)$$

where

T is the temperature in the vicinity of the specimen in degrees Celsius

T_0 is the temperature at the start of the test
in degrees Celsius

t is the time in minutes from the beginning
of the test.

Temperatures at selected time intervals for the ASTM/CSA,
U.K. and French tests are shown in Table I.

The French test provides slightly lower temperatures between 10 and 30 min but catches up at 1 hr and after that is a little higher than the ASTM test. Furnace temperatures in the ASTM, the CSA, and the French test are measured by thermocouples enclosed in metal tubes. In the British test bare thermocouples are used; this tends to make this test a little less severe in the early stages.

THERMOCOUPLES ON THE UNEXPOSED FACE

In the French fire test, thermocouples on the unexposed face are covered by asbestos pads as in the ASTM and CSA test methods.

HOSE STREAM

There is no provision for a hose-stream test in the French regulations. It is argued that the hose stream is rarely a significant factor in the test. It was removed from the British test in 1953.

SIZE OF TEST SPECIMEN

The minimum size of test specimen is less in the French test than in the other test methods described. Walls and partitions are 2 m (6 ft 7 in.) by 2 m (6 ft 7 in.) instead of 10 by 10 ft as in the British test or 9 ft and 100 sq ft as in the ASTM test. A comparison of the minimum sizes for test specimens is shown in Table II. A note to the French regulations says that the minimum sizes will be increased as soon as changes in the furnaces can be effected. The test reports published indicate that this has not yet been done.

In assemblies that fail by temperature rise on the unexposed surface, it may be assumed that the size of the specimen is not likely to influence the result significantly. When collapse of the specimen is the end point of the test, however, size will have some bearing on the result, although it is the practice of the French testing authorities to apply additional load to the test assembly to compensate for the reduction in size.

FIRE ENDURANCE CRITERIA

There are four criteria for failure in the French fire tests and three classifications of fire endurance. The end points are:

1. Structural stability. This includes the ability of an element to sustain the applied loads and to perform its intended functions.
2. Adequate thermal insulation.
3. Resistance to the passage of flames.
4. No emission of flammable gases on the non-exposed face.

Failure of thermal insulation is defined as the time when the average temperature rise on the non-exposed face reaches 140°C (252°F) above the temperature at the start of the test or when the maximum temperature rise at any point reaches 180°C (324°F). This is the same as in the other test methods described.

The classifications adopted in the French test for behaviour in the fire test are as follows.

(a) "Stables au feu" describes the performance of elements for which only criterion No. 1 - structural stability - is required.

(b) "pare-flammes" describes the performance of elements for which the criteria of structural stability, resistance to the passage of flames, and no emission of flammable gases (Nos. 1, 3, and 4 above) are required.

(c) "coupe feu" describes the performance of elements for which all of the criteria described above (1 - 4) are required. Degrees of fire endurance in relation to the above classifications are expressed in the following increments, 6 hr, 4 hr, 3 hr, 2 hr, $1\frac{1}{2}$ hr, 1 hr, $\frac{1}{2}$ hr, and $\frac{1}{4}$ hr. For elements transparent to heat such as glass products, and for metal panels, thermocouples are mounted at distances from the centre of the test specimen of 0.6 m (2 ft 0 in.) and 1 m (3 ft 3 in.) and 1.5 m (5 ft 0 in.).

TEST REPORTS

Summary extracts from published reports of French fire tests covering assemblies that can be identified without reference to trade name are included in Appendix A. The information is taken from:

Cahiers du Centre Scientifique et Technique
du Bâtiment No. 71, Cahier 602, December 1964,

described as

"Tableau Récapitulatif général des classements relatifs à la résistance au feu."

It should be noted that the brief descriptions in the tables do not fully identify the test specimens. Methods of fastening, for example, can be of great importance. The right-hand column in each table refers to the Cahiers of the Centre Scientifique et Technique du Bâtiment, where more detailed reports of the tests are given. For example, 27/232 in the table means No. 27 of Cahier 232 du Centre Scientifique et Technique du Bâtiment.

In the original reference document (No. 71, Cahiers 602) there are descriptions of 364 tests. Only 56 of these have been reproduced in this paper. Some of these were omitted because the fire endurance was less than 15 minutes, and some because the test specimens were very small. By far the greater number of omissions, however, has been because test specimens included materials described by trade name that consequently could not be adequately identified or compared with North American products.

For each of the test references shown in Appendix A, an English version has been provided including conversion of units of measurement to North American practice. The descriptions in English in Appendix B include supplementary information derived from the more detailed test reports referred to in Appendix A.

TABLE I
COMPARISON OF TIME TEMPERATURE CURVES
IN THE STANDARD TESTS

Time	Furnace Temperatures °C		
	C. S. A. and A. S. T. M.	U. K.	France
5 min	538* (1000°F)	538	556
10 min	704 (1300°F)	704	659
30 min	843 (1550°F)	843	821
1 hr	927 (1700°F)	927	925
2 hr	1010 (1850°F)	1010	1029
3 hr	1052 (1925°F)	1075	1090
4 hr	1093 (2000°F)	1121	1133

* Equivalent degrees Fahrenheit are shown below degrees Celsius for A. S. T. M. test.

TABLE II
MINIMUM DIMENSIONS FOR TEST SPECIMENS
IN THE STANDARD TESTS

Element	Minimum Dimensions of Specimen		
	ASTM/CSA	U. K.	France*
Doors and Screens	to represent installation**	to represent installation**	1.10 m (3 ft 7 in.) x 1.70 m (5 ft 7 in.) proposed 2 m (6 ft 7 in.) x 2.5 m (8 ft 2 in.)
Walls and Partitions	9 ft and 100 sq ft	10 ft x 10 ft	2 m (6 ft 7 in.) x 2 m (6 ft 7 in.) proposed 3 m (9 ft 10 in.) x 3 m (9 ft 10 in.)
Columns	9 ft	10 ft	2.30 m (7 ft 6 in.) proposed 3 m (9 ft 10 in.)
Beams	12 ft***	10 ft	4 m (13 ft 2 in.)
Floors	12 ft and 180 sq ft	10 ft x 10 ft	3 m (9 ft 10 in.) x 4 m (13 ft 2 in.)

* Proposed dimensions are those which will come into effect in France when changes in furnaces are made (see text).

** No minimum dimension specified but the test specimen is required to represent that which would be installed in a building.

*** 12 ft is a minimum dimension for steel beams in CSA test, ASTM E119 has no provisions for testing beams other than in a floor assembly.

APPENDIX A

Tableau Récapitulatif Général des Classements Relatifs
à la Résistance au Feu. Cahiers du Centre Scientifique
et Technique du Bâtiment No. 71, Cahier 602, Dec. 1964.

LEGENDES DES SYMBOLES

Eléments de construction:

MC. Murs et cloisons.
Hb. Hublots.
Pt. Portes.
Pu. Poteaux.
Pr. Planchers.
Prt. Planchers translucides.
Pe. Poutres.

Classements:

S. F. Stabilité au feu.
P. Fl. Pare-flammes.
C. F. Coupe-feu.
NC. Non classable (durée de résistance au feu < 15 mn).

Renseignements supplémentaires:

DS. Essai spécial.
c. Classement résultant de l'application d'une peinture ou d'une enduction protectrice sur les faces extérieures de l'élément (MC ou Pt) ou l'huisserie.

Critères de fin d'essai:

ΔT_M Echauffement maximal trop élevé.
 ΔT_m Echauffement moyen trop élevé.
F Flèche dépassant la valeur critique.
I Inflammation de la face non exposée ou passage de gaz susceptibles d'être enflammés.
P Perforation.
A ou E Affaissement ou écroulement
S Arrêt de l'essai au bout d'une durée fixée contractuellement, l'élément continuant à satisfaire aux conditions requises.
R Risques particuliers imposant l'arrêt immédiat : danger sérieux d'écroulement par exemple.

PLANCHERS (Pr.)					
DEGRE 1/4 D'HEURE					
Pr. 26 S	61 1168	Plafond constitué par des caissons en métal déployé garni de laine de verre et suspendu à une charpente métallique en IPN de 200 mm; les classements (S) indiqués correspondent à un échauffement moyen des fers de la charpente égal à 300°C.	S. F. (S) 16 mn	ΔT_m	59/479
Pr. 27	61 1191 A	Elément de plafond placoplâtre, les panneaux de 10 mm d'épaisseur, habillés de papier kraft sur leurs deux faces, étant cloués sur des bastaings espacés de 0.50 m.	C. F. 16 mn 1/2	I	59/479
DEGRE 1 HEURE					
Pr. 20	993 R. 09	Plancher constitué par une dalle de 4 cm nervurée (hauteur totale au droit des poutrelles 25 cm) bacula avec enduit de plâtre de 1.5 cm. Portée libre : 4 m, charge totale 3 tonnes, appuis libres, sans contraintes latérales.	C. F. 1 h 20 mn	ΔT_M	50/397
DEGRE 2 HEURES					
Pr. 21	993 R. 99	Plancher en bois, d'un type traditionnel, avec hourdis en augets, constitués de débris de briques avec plâtre, et bacula revêtus de 15 mm de plâtre. Portée libre : 4 m, charge totale : 3 tonnes, appuis libres, sans contraintes latérales.	C. F. 2 h 8 mn	R	50/397

APPENDIX B

GENERAL SUMMARY OF FIRE RESISTANCE CLASSIFICATIONS

(English translation of Appendix A to this paper including some supplementary information taken from detailed test reports referred to in Appendix A.)

MEANING OF SYMBOLS

Elements of Construction

MC	Walls and Partitions
Hb	Ports (round windows)
Pt	Doors
Pu	Columns
Pr	Floors
Prt	Translucent Floors
Pe	Beams

Classification of Fire Resistance

SF	Structurally stable in fire
PF1	Barrier to flames
CF	Fire stop
NC	Not classifiable (fire resistance less than 15 min)

Supplementary Information

DS	Special test
C	Classification due to application of paint or protective covering on exterior surfaces of wall of door or frame

Criteria for terminating test

ΔT_M	Maximum temperature rise too high
ΔT_m	Average temperature rise too high
F	Deflection succeeding the critical value
I	Flaming on the non-exposed face or passage of flammable gases
P	Perforation of the element
A or E	Destruction or collapse
S	End of test at an agreed time. The element continuing to satisfy all the required conditions
R	Particular hazards requiring immediate termination of test: for example, serious danger of collapse.

APPENDIX B - 3

GENERAL SUMMARY OF FIRE RESISTANCE CLASSIFICATIONS

Ref. No.	Test No.	Brief Description of Test Assembly	Fire Endurance	Cause of Failure	Ref. to more Detailed Description
WALLS AND PARTITIONS					
MC 15	91 590 B	<p>Partition 1.5 m (4 ft 11 in.) by 2.0 m (6 ft 7 in.) by 0.05 m (2 in.) of fir boards 0.018 m (.70 in.) thick fastened to both sides of vertical wood framing members with glass wool and kraft paper between.</p>			27/232
MC 31	57 389	<p>Solid partition 2.0 m (6 ft 7 in.) x 2.3 m (7 ft 6 in.) consisting of two layers of t and g fir with a sheet of asbestos between. Over-all thickness 0.043 m (1.7 in.).</p>	CF 19 min	D	30/252
MC 68	56 223 G	<p>Partition 2.0 m (6 ft 7 in.) by 2.3 m (7 ft 6 in.) by 0.06 m (2.35 in.) thick consisting of one layer of gypsum wallboard 0.01 m (.39 in.) thick fastened to each side of a wood frame, studs 0.04 m (1.57 in.) by 0.04 m (1.57 in.) at 0.40 m (15.7 in.) apart.</p>	CF 21 min	I	-
MC 109	61 1192 B	<p>Partition 2.0 m (6 ft 7 in.) by 2.3 m (7 ft 6 in.) by 0.05 m (2 in.) thick consisting of two layers of gypsum wallboard 0.01 m (.39 in.) thick with a cardboard egg crate type of framing between. A vertical joint in the centre of the specimen was formed around a wood spline and the wallboard joints were taped and filled.</p>	CF 29 min	-	43/341
					56/445
