PROGRAMMER'S REFERENCE MANUAL FOR A  
DIGITAL CRT DISPLAY

J. K. Pulfer

OTTAWA  
AUGUST 1968

## ABSTRACT

Command and data formats for a digital cathode-ray tube display are described. The display is used with a small digital computer as a testing ground for developments in hardware and software relating to man-machine communications problems. The information contained in this manual is sufficient to allow the user to write and to understand machine language display programs.

## INDEX OF DISPLAY COMMANDS

### *INTER REGISTER TRANSFERS*

- 1) No-op
- 2) Transfer zeros
- 3) Source 840A
- 4) Source XMEM
- 5) Transfer X and Y
- 6) Transfer event counter
- 7) Transfer mouse
- 8) Transfer shaft position encoders
- 9) Transfer control switches
- 10) Load scale factor register
- 11) Load rate registers ( $\Delta X$ ,  $\Delta Y$ )
- 12) Load X register
- 13) Load Y register
- 14) Load position (X and Y) registers
- 15) Transfer scale factor and load rate registers
- 16) Load D/A's
- 17) Clear mouse
- 18) Load event counter
- 19) Increment event counter

### *INTERRUPT CONTROL COMMANDS*

- 1) Arm event counter interrupt
- 2) Clear display event counter and disarm event counter interrupt
- 3) Start external buffer to display

- 4) Stop buffer core and raise interrupt (terminate)
- 5) Stop buffer core on light pen

#### *MEMORY (CONTROL) COMMANDS*

- 1) Initiate BTC transfer between 840A core and external buffer core
- 2) Set memory address register from 840A
- 3) Clear memory from 840A
- 4) Clear address register from 840A

#### *STORED MEMORY COMMANDS*

- 1) Branch
- 2) Stored branch with return

#### *READ-WRITE INSTRUCTIONS*

- 1) Read XMEM to 840A
- 2) Write 840A to XMEM
- 3) Read-modify-write from 840A
- 4) Read from display
- 5) Write to display
- 6) Read display status, keyboard, buffer memory address

#### *MODE CONTROL COMMANDS*

- 1) Blank
- 2) Plot a point
- 3) High speed plot
- 4) Plot a single character
- 5) Plot a character and X
- 6) Plot 4 characters
- 7) Plot a line segment
- 8) Plot a circular arc
- 9) Plot Y parabola
- 10) Plot X parabola

# PROGRAMMER'S REFERENCE MANUAL FOR A DIGITAL CRT DISPLAY

- J.K. Pulfer -

## INTRODUCTION

The cathode-ray tube digital display, which is used with a small computer\*, is primarily a research tool for both hardware and software development. At times it is also used as a communication device between the system executive and the operator or user. Because the display is used to test hardware ideas, its internal circuitry is continuously undergoing modification. It follows that any programmer's reference guide will be obsolete as soon as it is written. Nevertheless, there appears to be a need to collect in one location much of the information necessary to write display programs, and this report has been prepared to meet that need.

## HARDWARE DESCRIPTION

The CRT display together with its buffer core memory can be described as a special purpose computer capable of storing a wide variety of commands and data words and of executing the commands in either an on-line or off-line mode. In addition, a number of input devices are available through which analog and digital information supplied by an operator can be transmitted to the display and, if desired, forwarded to the computer.

Figure 1 is a simplified block diagram of some of the hardware elements in the processing system at the present time (March 1968). Figure 2 shows in more detail those elements which are part of the display system.

Data are transferred between computer, display, and keyboard in the form of 24-bit words, and between the buffer memory and display as 26-bit words.

24-bit computer words are interpreted by the display either as data words, or as command words.

A word may be recognized as a command word for one of three reasons:

- 1) It was produced by the execution of a CEU command in the computer CPU and is therefore accompanied by a command strobe at the interface between the display and the computer input/output bus.
- 2) It was produced by reading a word from the external core buffer in which the twenty-fifth bit in the word was set to a binary 1.
- 3) It was immediately preceded by a data word in which all 24 bits were zero (25 in the case of buffer memory). All other words will be interpreted as data words.

---

\*Systems Engineering Laboratories Model 840A

Command words are stored in the display command register (C register).

Data words are stored in the display data register (D register) and transferred to various other places in the display according to the current word in the command register. That is to say, the 24-bit data word is interpreted by the display according to the current word in the C register. The remainder of this guide will be used to define the various types of command word, and to show the resulting data word format which accompanies them.

There are also a number of command words which are interpreted only by the buffer memory and are, therefore, meaningless if transferred from the computer CPU to the C register.

## DISPLAY COMMANDS

### Instruction Format

- 1) Immediate, or real-time execution (direct from computer CPU to C register).

The mnemonic form of the instruction is:

CEU '40, W

DATA 'XBCDEFGH

where the Wait flag in the CEU instruction is optional.

'XBCDEFGH represents an 8-digit octal number defining the command. The functions of the various digits will be outlined below.

X must be zero.

- 2) Stored, or delayed execution (transferred from the computer CPU to the 4K buffer memory for later use).

CEU '41, W

DATA 'XBCDEFGH

where 'XBCDEFGH is an 8-digit octal number.

X must be zero.

- 3) Implied display command (following an all-zero data word).

DATA 'XBCDEFGH

where XBCDEFGH is an 8-digit octal number.

X must be zero.

- 4) Memory command word (a word which is interpreted only by the buffer memory and has no meaning to the display).

CEU '41,W

DATA 'XBCDEFGH

where X may not be zero.

#### DISPLAY COMMAND WORD FORMATS

Figure 3 is a block diagram of a portion of the display control unit showing some of the registers used in executing a display command. As outlined above, the word stored in the C register may be expressed as an 8-digit octal number 'XBCDEFGH.

The following examples describe the display behaviour for individual portions of the command word. An actual command may be made up of a number of these micro commands, and all will be executed simultaneously. There are, of course, some impossible or meaningless combinations.

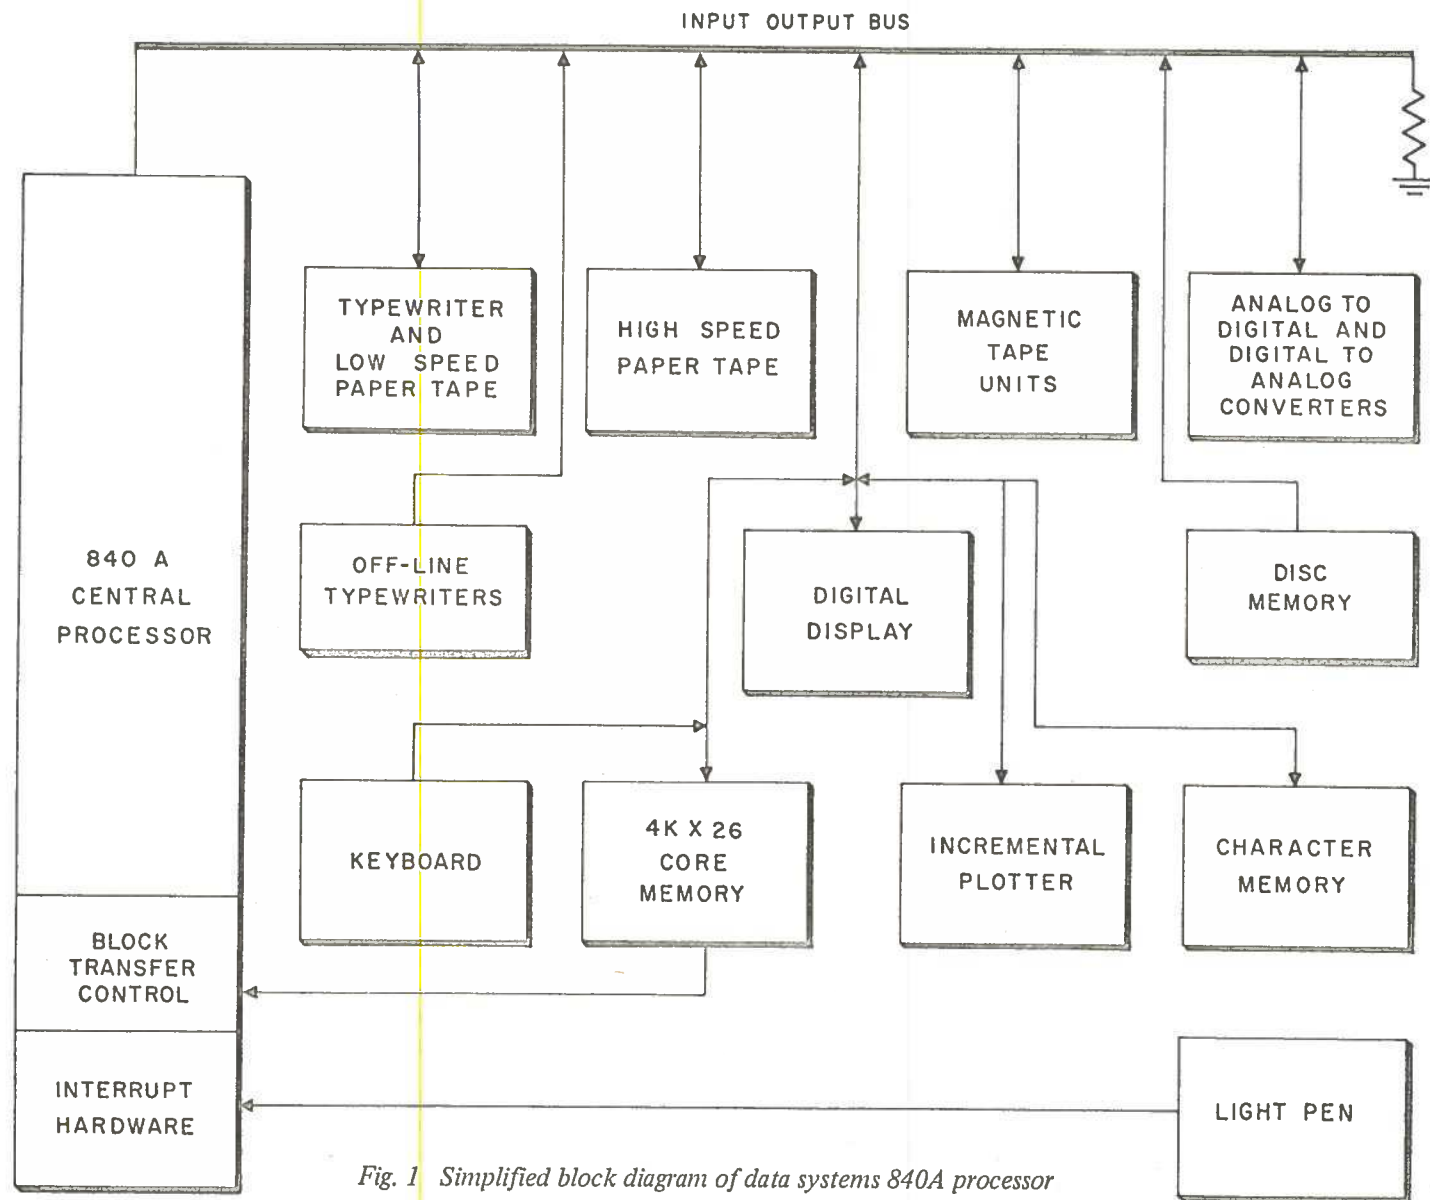

Fig. 1 Simplified block diagram of data systems 840A processor

NAME: *TRANSFER SCALE FACTOR AND LOAD RATE REGISTERS*

**TIMING:**  $\approx 3$  microseconds

ASSOCIATED DATA FORMAT:

Diagram illustrating the structure of a floating-point number (likely IEEE 754 single precision) stored in a 24-bit register:

- Sign Bit (0):** The first bit, labeled 0.
- Scale (SCALE):** A 16-bit field, labeled SCALE.
- Exponent:** A 2-bit field, labeled 2.
- Mantissa:** An 8-bit field, labeled 8.
- Extra Bits:** Two 1-bit fields, labeled X.

Bit positions are indicated below the register:

- 0: Sign bit position.
- MSB: Most Significant Bit position.
- LSB: Least Significant Bit position.
- 22: Position of the first extra bit.
- 23: Position of the second extra bit.

NOTES:

The contents of the scale factor register are loaded into the rate multiplier main counter to control the length of a line segment specified by D, E and F. The rate registers ( $\Delta X$  and  $\Delta Y$  and signs) are loaded with a value obtained from a source specified by H.

X			B			C			D			E			F			G			H		
0	0	0	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	1	1	1	x	x	x

D/A #1												D/A #2											
M												L	M										L
S												S	S										S
B												B	B										B

NOTES:

The contents of a source specified by H are transferred to the D register and loaded into the two non-display 12-bit digital to analog converters as shown in the format above.

X			B			C			D			E			F			G			H		
0	0	0	x	x	x	x	x	x	1	1	0	x	x	x	x	x	x	x	x	x	x	x	x
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23

NAME: *CLEAR MOUSE*

TIMING:  $\approx 2$  microseconds

ASSOCIATED DATA FORMAT:

N O N E																							
---------	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--

NOTES:

This command clears the counters associated with the MOUSE incremental encoder input device, and therefore effectively sets mouse position to the lower left corner of the display area.

X			B			C			D			E			F			G			H		
0	0	0	0	0	0	x	x	x	1	x	1	x	x	x	x	x	x	x	x	x	x	x	x
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23

NAME: *LOAD EVENT COUNTER*

TIMING:  $\approx 2$  microseconds

ASSOCIATED DATA FORMAT:

NOTES:

The event counter will be loaded on the next transfer with the number COUNT (bits 16 to 23) of the data word. The counter will count down from this value to zero and requesting an interrupt if armed.

X			B			C			D			E			F			G			H		
0	0	0	0	0	0	x	x	x	0	1	1	x	x	x	x	x	x	x	x	x	x	x	x
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23

NAME: *INCREMENT EVENT COUNTER*

TIMING:  $\approx$  2 microseconds

ASSOCIATED DATA FORMAT:

N O N E
---------

NOTES:

Note that for this command to be effective, digit B (bits 3, 4, 5) may not be set to 2 as this would clear the event counter.

### *DISPLAY INTERRUPTS*

At the present time, two hardware priority interrupts are assigned to the display interface. These are levels 5 and 6.

Level 5, which is connected to the light pen, causes the execution of an instruction at address '105 when light is seen.

Level 6, which is connected to the display C register, causes the execution of an instruction at '106 when the display event counter reaches zero (and has been armed) or when a terminate command is loaded into the display C register.

X			B			C			D			E			F			G			H		
0	0	0	0	1	1	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23

NAME: *ARM EVENT COUNTER INTERRUPT*

TIMING:  $\approx$  2 microseconds

ASSOCIATED DATA FORMAT:

N O N E

NOTES:

This command enables the event counter to request an interrupt on reaching a count of zero.

X			B			C			D			E			F			G			H		
0	0	0	0	1	0	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

TIMING: N/A

ASSOCIATED DATA FORMAT:

NONE
------

NOTES:

If a command is issued in which digit B is 4, then any succeeding interrupt generated by the light pen will terminate operation from external buffer core. This command can be cancelled by issuing any command in which  $B \neq 4$ .

### *MEMORY COMMANDS*

The following commands and combinations of them, which are performed by executing a CEU '41 instruction, allow the 840A CPU to control the operation of the external buffer memory.

X			B			C			D			E			F			G			H		
1	x	1	x	0	x	0	0	0	0	0	0	x	x	x	x	x	x	x	x	x	x	x	x
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23

NAME: *INITIATE BTC TRANSFER BETWEEN 840A CORE AND EXTERNAL BUFFER CORE*

TIMING: Depends on block size and direction as well as maximum transfer rate bit.

ASSOCIATED DATA FORMAT:

N O N E																							
---------	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--

NOTES:

If Bit 1 is present, starting address is given by bits 12–23

If Bit 3 is present, maximum rate transfer is used

If Bit 5 is a 1, transfer is XMEM to 840A

If Bit 5 is a 0, transfer is 840A to XMEM

X			B			C			D			E			F			G			H		
0	1	1	0	0	0	x	0	0	0	0	0	x	x	x	x	x	x	x	x	x	x	x	x
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23

NAME: *SET MEMORY ADDRESS REGISTER FROM 840A*

TIMING:  $\approx$  10 microseconds

ASSOCIATED DATA FORMAT:

N O N E

NOTES:

This command sets both the read and write address registers in the buffer memory to the address specified by bits 12 to 23.

If bit 6 is a 1, the memory is set to the half-cycle mode; i.e., read-clear, or write without clear.

If bit 6 is a 0, the memory is set to full cycle-mode; i.e. clear-write and read-restore.

X			B			C			D			E			F			G			H		
0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23

NAME: *CLEAR MEMORY FROM 840A*

TIMING:  $\approx$  6 milliseconds

ASSOCIATED DATA FORMAT:

N O N E
---------

NOTES:

This command initiates a buffer memory clear operation which sets all bits of all words to zero.

X			B			C			D			E			F			G			H		
0	0	1	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23

NAME: *CLEAR ADDRESS REGISTER FROM 840A*

TIMING:  $\approx$  10 microseconds

ASSOCIATED DATA FORMAT:

N O N E
---------

NOTES:

External buffer address registers are set to zero.

*STORED MEMORY COMMANDS*

The following two commands can be stored in external buffer memory by executing CEU '41 instructions and will actually be executed themselves only when requested by the display. These stored commands control the path of the display program through buffer core as it is being executed.

X			B			C			D			E			F			G			H		
0	1	0	0	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x	x	x	x	x
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23

NAME: *BRANCH*

TIMING:  $\approx 1.75$  microseconds

ASSOCIATED DATA FORMAT:

N O N E																							
---------	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--

NOTES:

This command, stored in external buffer memory, causes it to change its address register to the value specified in bits 12–23. It can be used to link subprograms, or to restart display loops.

X			B			C			D			E			F			G			H		
0	1	0	0	1	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x	x	x	x	x
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23

NAME: *STORED BRANCH WITH RETURN*

TIMING:  $\approx$  4 microseconds

ASSOCIATED DATA FORMAT:

N O N E																							
---------	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--

NOTES:

This instruction, stored in external buffer, causes a branch to the address following that specified by bits 12 through 23. The address of the next sequential location in memory is stored as a return branch at the subroutine entry point.

*READ-WRITE INSTRUCTIONS*

This set of 840A instructions can be used for program controlled data transfer between the 840A core and the display interface. Block transfer of data is included under memory commands.

X			B			C			D			E			F			G			H		
									NONE														
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23

NAME: *READ XMEM TO 840A*

TIMING:  $\approx 7$  microseconds

ASSOCIATED DATA FORMAT:

24-BIT DATA WORD																							
------------------	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--

NOTES:

A READ will result from either an AIP '41 or an MIP '41 instruction. In either case, bit 24 of the XMEM data word will be ignored.

X			B			C			D			E			F			G			H		
0	0	0	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23

NAME: *WRITE 840 TO XMEM*

TIMING:  $\approx 9$  microseconds

ASSOCIATED DATA FORMAT:

NOTES:

A WRITE will result from either a MOP '41 or an AOP '41, in which case bit 24 in the buffer word will be set to zero.

A WRITE will also result from the execution of a CEU '41 with bits 0-2 of word 2 set to zero. In this case, bit 24 of the stored data word will be set to 1.

X			B			C			D			E			F			G			H		
0	x	1	0	0	0	0	1	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23

NAME: *READ MODIFY WRITE FROM 840A*

TIMING:  $\approx 9$  microseconds

ASSOCIATED DATA FORMAT:

NOTES:

This instruction results in a data transfer between 840A and external buffer memory. Only the zones selected are changed in external memory.

- Bit 11 selects zone 1
- Bit 10 selects zone 2
- Bit 9 selects zone 3
- Bit 8 selects zone 4
